Abstract

This paper provides a first-hand understanding about the procedures taken by Turkish business firms and their logistics providers and supply chain business firms to operate in an environmentally friendly supply chain. The main point of the study is to examine the influence of both external and internal parties on green supply chain management (GSCM) practices in business firms. The result of this research is very important to promote performance of Turkish business relations in their green perspectives. In order to find the correct answers, comprehensive questionnaire forms were designed. We collected data from 2014 May to 2015 July through Turkish companies. More than 180 companies contributed in this extensive research. Then the derived data were analyzed using statistical methods. One of the important inferred results is that the third party logistics service providers influence firms to have a proactive green behavior.

Keywords: Green supply chain management; Turkish companies; Statistical methods; performance of Turkish business relationships.

1. Introduction

Becoming green is a never ending debate between the competitors of any firms, especially in the last decade. Applying green supply chain practices rather than traditional ones can help organizations to develop win-win strategies which assist them to reach profit and market share objectives by lowering their environmental risks and impacts, while raising their ecological efficiency (Zhu, Q., et al. 2007). Green supply chain management (GSCM) can be defined as integrating environmental issues into supply-chain management, including the processes from product design to end-of-life management of the product after its useful life (Aksoy, A., et al. 2014). There are different motivators and actors encouraging companies to switch to 'green' in their supply chain (Rostami-Fard, M., et al. 2014). Supply chains strive to maintain their internal health and environmental sustainability using the capability of self-correction based on information from the external environment (Kenneth, W., et al. 2012). The external forces like government rules, society, customers, third parties and the partnership of the firms motivate firms to apply the green practices in their supply chain (Ball, A. and Craig, R., 2010) and (Zhu, Q. and Liu, Q., 2010). On the other hand internal forces like stakeholder pressures are also considered to be the principal drivers of green efforts (Foerstl, K., et al. 2015). But it is still unclear how external and internal drivers effect GSCM practices.

The institutional theory determines how external forces influence organizational actions (Lai, K.H., et al. 2006). GSCM practices are a kind of organizational action that reduce environmental impact while flow products and services from origin to end customers. The theory explains the external drivers as government, the important customers and partnerships (Sarkis, J., et al. 2011). So there can be a connection between GSCM practices and institutional theory.

In this research, we make some important contributions: Firstly, we examine how external and internal drivers promote GSCM practices based on institutional theory. Secondly, we determine to find the major driver of GSCM practices. After a brief review on the literature, we realized that very few studies have just concentrated on manufacturing firm's GSCM practices all around the world. The Body Shop, British Telecom, Nissan, Nortel, Yorkshire and Humberside are the well-known manufacturing companies that implement green supply chain (Preuss, L., 2001). When we categorized the studies based on countries, again very limited studies was found; in the UK, B2B supply chains are increasingly demanding green performance from their suppliers (Hoejmose, S., et al. 2012). Another research showed that Indian manufacturing companies have accepted the positive impact of GSCM practices in terms of business and environmental performance of their firms (Dubey, R., et al. 2015). The linkage between corporate environmental strategies and stakeholder management has been evaluated with an empirical application in Belgium manufacturing firms (Buyse, K. and Verbeke, A., 2003). Another research showed us, based on the data collected from Jordan, the internal environmental management has a significant effect on the green supply chain performance (Al Khattab, S.A. and As'ad, H., 2015).

In that view, empirically researches about manufacturing companies are still limited. Our other motivation is our data sample which has been collected from Turkey's manufacturing firms. To the best of our knowledge, the literature just analyzed the manufacturing companies' green actions

however there is still lack of information about logistic services provider's pressure on GSCM practices. Logistics service providers are the main actors that should play a leading role in environmental protection and green issues. The logistics companies need to take into account environmental protection issues in addition to the standard logistics imperatives for efficient, effective, and fast handling and movement of goods (Lin, C.Y. and Ho, Y.H., 2011).

In order to fill the gaps between mentioned topics, this research aims to study the external and internal actor's effects on the adoption of GSCM practices for both manufacturing companies and logistics providers.

The rest of this paper is organized as follows: Section 2 describes problem definition, Section 3, proposes results and analysis of this research. Section 4, conclusion, contains discussion and future research directions.

2. Methodology

Data Collection

The study is concerned with the phenomena of GSCM so the main aim of this paper is to determine differences between the service and production companies' perception of GSCM practices in reality. The study was carried out in Turkey. Turkey has signed the Kyoto Protocol ten years ago and will start to apply Kyoto Protocol's rules after 2014. So the green practices are getting more important than before. Furthermore, Turkish companies needs to promote their business relationships with international companies and GSCM can help them in this way.

As the study is about measuring green efficiency of the supply chains, the population included different sectors of both manufacturing companies and logistics service providers. In this regard, a self-administrated questionnaire was developed. The questionnaire forms are added to Appendix. A. This questionnaire tried to measure firm's commitment to operate as an environmentally friendly firm. The survey was divided into two sections. In the first part, companies have to report a number of the firm's basic facts. In the second part, companies report the firm's measures that have been taken for implementing green supply chain practices, what kind of effect they have had on firm's performance, level of dependence and trust between firm and its important customers, whether firm has made any special investments to implement green supply chain management (GSCM) practices and have started innovative measures with its important customers or not. The questionnaire was sent via email to the profit-organizations. From the target sample of 200 questionnaires, only 181 completed questionnaires were returned from 2014 May to 2015 July. Respondents of the survey were obligated to consider at least 5 years' experience in the supply chain departments of the companies. The questionnaires were completed voluntarily by all respondents. A five-point Likert scale was used for data collection with different meanings such as 1, being strongly disagreed at all and 5, being strongly agree. IBM SPSS Statistics 20 for Windows was employed in order to obtain the results.

In this research, we have a main and sub hypothesizes to analyze the GSCM practices.

H₁: There is a significant difference in perception of GSCM practices between service and production sectors Based on that question, we divided our population into two groups; logistics and manufacturing sector.

In addition to descriptive statistics, t-test was used to analyze hypothesizes.

Analysis

Firstly, descriptive analyses were conducted. The age range of the firms was 2-94 years with a mean 20. 81. Among them, 22% were 2-10 years, 34.8% were 11-20 years, 30.2 % were 20-38 years and 13% were 38-94 years old. The main business activity of the firms was manufacturing (73.7%) followed by the service sector (Logistics 25.3% and Tourism 1%). Based on the full time employee measure, 7.8% had less than 14 employees, 32.5% had 15-28 employees, 41.2% 29-100 employees, %14.6 101-749 employees, and 3.9% had more than 750 employees in their firm. 71.3% of the firms worked with local customers and 28.7% of the firms worked with international customers. The overall reliability of the scale got acceptance due to the amount of alpha coefficient with 0.926 confidence level.

In the following sections, we have analyzed the statistical significance in perceptions of asked questions for two distinctive groups (i.e., Logistics Company and manufacturing company). As you can find, the independent t-tests were performed using SPSS statistical package (Version 20). The shaded areas are statistically significant with a 95% confidence interval (i.e., $\alpha=0.05$) in the mean value of collected data for each equation about two distinctive groups (i.e., “L” for logistics company, “M” for manufacturing company). Above all, it could be a reasonable statement on the degree of business dependency between target companies and their customer.

Table 1. Statistical analyses for the degree of customer’s dependency on Target Company

Group Statistics					
	Group	N	Mean	Std.Deviation	Std. Error Mean
6-1	L	43	3.70	1.166	.178
	M	138	3.26	1.395	.119
6-2	L	43	3.42	1.159	.177
	M	138	3.80	1.088	.093
6-3	L	43	3.12	1.117	.170
	M	138	2.86	1.233	.105
6-4	L	43	3.47	1.334	.203
	M	138	3.10	1.379	.117

As seen in Table 1, both group of target companies have the same idea about the customer’s dependency on themselves; there is no statistical difference in results.

Table 2. Statistical analyses for the degree of company’s dependency on customer

Group Statistics					
Group	N	Mean	Std.Deviation	Std. Error Mean	
7-1	L	43	3.40	1.218	.186
	M	138	3.32	1.039	.088
7-2	L	43	3.05	1.308	.200
	M	138	2.80	1.122	.095
7-3	L	43	3.63	1.113	.170
	M	138	3.30	1.130	.096
7-4*	L	43	3.65	1.066	.163
	M	138	3.09	1.162	.099

*: Statistically significant at a significant level of $\alpha=0.05$

However, as seen in Table 2, a group of logistics companies strongly think that they have no substitutable customer and the result is a higher dependency on their customers.

Table 3. Statistical analyses for the degree of feeling about the customer

Group Statistics					
Group	N	Mean	Std.Deviation	Std. Error Mean	
8-1*	L	43	4.07	.961	.147
	M	138	3.59	1.254	.107
8-2	L	43	4.28	.882	.134
	M	138	4.33	.794	.068
8-3	L	43	4.02	.913	.139
	M	138	4.06	.926	.079
8-4	L	43	3.88	1.258	.192
	M	138	4.07	1.020	.087

*: Statistically significant at a significant level of $\alpha=0.05$

In addition, as seen in Table 3, a group of logistics companies tends to believe that their customers are more sincere with them compared with a group of manufacturing companies.

Table 4 shows the statistical analyses of the question on the external green actions for building close cooperation with customers for both groups, i.e., question 2 in Appendix. A.

Table 4. Statistical analyses for the degree of close cooperation with customer

Group Statistics					
	Group	N	Mean	Std.Deviation	Std. Error Mean
2-1	L	43	3.93	.936	.143
	M	138	4.20	.921	.078
2-2*	L	43	3.74	1.002	.153
	M	138	3.30	1.098	.093
2-3*	L	43	2.79	1.206	.184
	M	138	2.18	1.027	.087
2-4*	L	43	3.00	1.195	.182
	M	138	2.41	1.023	.087
2-5*	L	43	3.02	1.336	.204
	M	138	2.46	1.147	.098
2-6*	L	43	3.79	.965	.147
	M	138	3.27	.986	.084
2-7	L	43	4.02	1.058	.161
	M	138	4.09	.908	.077
2-8	L	43	3.28	1.260	.192
	M	138	3.09	1.171	.100

*: Statistically significant at a significant level of $\alpha=0.05$

As seen in Table 4, two groups have statistical significant difference in several ones which are shaded in grey with a symbol of asterisk. Based on the statistical analyses, it is known that a group of logistics companies tends to have a higher perception about more close cooperation with customer externally.

Table 5. Statistical analyses for the degree of green actions internally

Group Statistics					
Group	N	Mean	Std.Deviation	Std. Error Mean	
3-1	L	43	4.44	1.402	.214
	M	138	4.48	1.352	.115
3-2*	L	43	3.72	1.161	.177
	M	138	3.12	1.264	.108
3-3*	L	43	4.12	1.028	.157
	M	138	3.63	1.134	.097
3-4	L	43	3.23	1.411	.215
	M	138	3.07	1.236	.105
3-5*	L	43	3.23	1.509	.230
	M	138	2.57	1.226	.104
3-6*	L	43	3.42	1.435	.219
	M	138	2.72	1.213	.103

*: Statistically significant at a significant level of $\alpha=0.05$

Based on the statistical analyses in Table 5, a group of logistics companies has a higher level of internal commitment guideline and program for green actions compared with a group of manufacturing companies.

Table 6. Statistical analyses for the degree of company’s management supports

Group Statistics					
Group	N	Mean	Std.Deviation	Std. Error Mean	
4-1	L	43	3.70	1.337	.204
	M	138	3.38	1.148	.098
4-2	L	43	3.86	1.082	.165
	M	138	3.50	1.179	.100
4-3	L	43	3.88	1.276	.195
	M	138	3.72	1.340	.114
4-4	L	43	3.79	1.186	.181
	M	138	3.61	1.270	.108

However, although a group of logistics companies tends to show a slightly higher perception, there is no statistically significant difference in the perception of company’s management about the environmentally friendly supply chain between two groups as seen in Table 6.

Table 7. Statistical analyses for the degree of company's benefits

Group Statistics					
Group	N	Mean	Std.Deviation	Std. Error Mean	
5-1*	L	43	3.33	1.286	.196
	M	138	2.78	1.290	.110
5-2	L	43	4.02	.963	.147
	M	138	3.83	1.208	.103
5-3	L	43	4.16	.785	.120
	M	138	3.86	1.135	.097
5-4	L	43	3.98	1.058	.161
	M	138	3.84	1.210	.103
5-5	L	43	3.88	1.074	.164
	M	138	3.90	1.109	.094
5-6	L	43	3.93	1.142	.174
	M	138	3.85	1.107	.094
5-7	L	43	3.79	1.059	.162
	M	138	3.67	1.096	.093
5-8	L	43	3.37	1.363	.208
	M	138	3.39	1.298	.111
5-9	L	43	3.51	1.183	.180
	M	138	3.46	1.221	.104
5-10	L	43	3.47	1.241	.189
	M	138	3.28	1.195	.102
5-11	L	43	3.60	1.237	.189
	M	138	3.82	1.303	.111
5-12	L	43	3.44	1.259	.192
	M	138	3.48	1.314	.112
5-13	L	43	3.93	1.261	.192
	M	138	4.02	1.229	.105
5-14	L	43	3.72	1.076	.164
	M	138	3.63	1.127	.096
5-15	L	43	3.88	1.005	.153
	M	138	3.84	.998	.085
5-16	L	43	3.91	.947	.144
	M	138	3.89	1.030	.088

*: Statistically significant at a significant level of $\alpha=0.05$

In addition, the business benefit could be assessed by practicing environmentally friendly supply chain practices such that a group of Logistics Companies got a higher benefit by reducing the cost of purchased materials after deploying the environmentally friendly supply chain practices.

Table 8. Statistical analyses for the detailed actions or practices for green supply chain

Group Statistics					
Group	N	Mean	Std.Deviation	Std. Error Mean	
9-1	L	43	3.98	1.244	.190
	M	138	3.84	1.167	.099
9-2*	L	43	3.81	1.258	.192
	M	138	3.17	1.329	.113
9-3*	L	43	3.51	1.437	.219
	M	138	2.95	1.325	.113
9-4*	L	43	3.40	1.530	.233
	M	138	2.70	1.432	.122
9-5*	L	43	3.19	1.500	.229
	M	138	2.54	1.399	.119
9-6	L	43	4.00	1.175	.179
	M	138	3.95	1.148	.098

*: Statistically significant at a significant level of $\alpha=0.05$

Finally, from the Table 8, it could be known that a group of Logistics Companies has tried to deploy the eco-friendly actions or practices for green supply chain such as the use of recycled, remanufactured materials or parts, process redesign of reverse logistics, and product/service redesign.

3. Conclusion

In Turkey, GSCM practices are starting out with a long way to travel and there are still rooms for application of logistics activities in a green way. In spite of having ISO 14000, the customers are not aware of the benefits of this certification properly. The important contributions of this research are to examine how external and internal drivers promote GSCM practices based on institutional theory and determine to find the major driver of GSCM practices. In this regard, a self-administrated questionnaire was developed. This questionnaire tried to measure firm's commitment to operate as an environmentally friendly firm. In the first part, companies had to report about a number of their basic facts. In the second part, companies reported about the measures that have been taken for implementing green supply chain practices, what kind of effect they have on firm's performance, level of dependence and trust between firm and important customers, whether firm has made any special investments for implementing green supply chain management (GSCM) practices and have started innovative measures with its important customers. The questionnaire forms were added to Appendix. A. We collect data from 2014 May to 2015 July through the Turkish companies. More than 180 companies have contributed in this extensive research. IBM SPSS Statistics 20 for Windows was employed in order to obtain the results. In addition to descriptive statistics, t-test was used. In the following sections, we have analyzed the statistical significance in perceptions of asked questions for two distinctive groups (i.e., Logistics Company and manufacturing company). As you find, the independent t-tests were performed using

SPSS statistical package (Version 20). 95% confidence interval (i.e., $\alpha=0.05$) in the mean value of collected data for each equation about two distinctive groups (i.e., “L” for logistics company, “M” for manufacturing company) are considered.

Based on the statistical analyses, two groups, i.e., group of logistics companies and group of manufacturing companies, have a very strict different perception in GSCM practices in Turkey. Overall assessment could be summarized as follows: Firstly, a group of logistics companies has a higher perception on the dependency with their customers. Secondly, logistics companies have tried to implement key actions or practices in GSCM compared with manufacturing companies. Also, logistics companies think that they get economic benefits by reducing the purchasing cost which can be reached by GSCM practice. Our findings is in line with the study of [16] which found business firms need to advance their operational, economic performance and build a strong internal green practices in order to accomplish the environmental performance. A noticeable finding is that there must be a clear gap in perception of GSCM practices between two target groups, although it must be an inevitable component for both groups to have the common target or business philosophy for a successful implementation of GSCM framework. Thus, it is necessary to develop a common platform to make them work and cooperate with each other. For future studies one may be able to try to apply other statistical analyses.

Appendix. A Survey Questionnaire

Green Supply Chain Management (GSCM) Practices' Effect on the Performance of Turkish Business Relationships

For each and every question, please use the given 5 level value scale. The scale ranges from 1 to 5 where **1** *represents* "Strongly disagree" and **5** *represents* "Strongly agree". You must answer by setting a ring around one of the values in the scale which you think that best reflects your evaluation for the question.

For example:

Strongly disagree

Strongly agree

We are an international exporting firm 1 2 3 4 5

Part One: Descriptive Questions

1. Our firm has been doing this business since the year: _____
2. The main business activity of our firm is: _____
3. The total annual revenue of our firm in the year 2013 was: _____ €/ \$US/ TRY
4. The total number of full time employees in our firm is: _____
5. Our firm mainly works with industrial customers pertaining to:

Automobile Chemical, Rubber & Plastic Power Generation Steel Food Products & Beverages Computer & Electronics Petroleum Pharmaceutical Any Other Industry _____

Part Two: Customer Side

6. The chosen customer is: a Local Customer or an International customer
7. Our firm has been doing business with this customer for the last _____ Years.
8. The total sales volume for this customer in the year 2013 was _____ €/ \$US/ TRY.

Part Three: Company Side

- Does your company apply the following actions externally? Strongly *Disagree* Strongly *Agree*

1. certification. It is important that the customer has ISO 14000 certification. 1 2 3 4 5
2. There is a close cooperation with customer to achieve environmentally friendly goals. 1 2 3 4 5
3. There is a close cooperation with customer to use green packing. 1 2 3 4 5
4. There is a close cooperation with customer to use environmentally friendly handling procedures. 1 2 3 4 5
5. There is a close cooperation with customer to regularly evaluate environmentally friendly practices. 1 2 3 4 5
6. It is important that environmentally friendly practices are followed by us and our customer. 1 2 3 4 5
7. It is important that our customer has tendency to avoid or reduce usage of hazardous products. 1 2 3 4 5
8. It is important that our customer follows some kind of recyclable procedures. 1 2 3 4 5

• **Does your company apply the following actions internally?**

1. Our firm has ISO 14000 certification. 1 2 3 4 5
2. There is an environmental management system in our firm. 1 2 3 4 5
3. Our top managers support environmentally friendly practices. 1 2 3 4 5
4. There is a regular internal environmentally friendly practices evaluation. 1 2 3 4 5
5. There exists an internal environment compliance and audit program. 1 2 3 4 5
6. There is a close internal cross-functional cooperation

9. Environmentally friendly supply chain practices have
 1 2 3 4 5 improved/increased the quality of products or services.

10. Environmentally friendly supply chain practices have
 1 2 3 4 5 improved/increased the capacity utilization

11. Environmentally friendly supply chain practices have
 1 2 3 4 5 decreased the production waste.

12. Environmentally friendly supply chain practices have
 1 2 3 4 5 decreased the level of inventory.

13. *Environmentally* friendly supply chain practices have helped
 1 2 3 4 5 to improve the environmental image of the company.

14. Environmentally friendly supply chain practices have led to
 1 2 3 4 5 reduction of waste water.

15. Environmentally friendly supply chain practices have led to
 1 2 3 4 5 reduction of solid wastes.

16. Environmentally friendly supply chain practices have led to
 an improvement in company's environmental condition. 1 2 3 4
 5

• **Is this customer dependent on our company for business?**

1. This customer is dependent on us. 1 2
 3 4 5

2. We are important to this customer. 1 2
 3 4 5

3. We purchase a large proportion of this customer's
 1 2 3 4 5 total production volume.

4. If we stopped doing business with this customer, this
 1 2 3 4 5 customer would find it difficult to find adequate orders.

• **Is your company dependent on this customer?**

Green Supply Chain Management Practices' Effect on the Performance ...

1. This customer is crucial for our future performance.
1 2 3 4 5

2. It would be difficult for us to replace this customer.
1 2 3 4 5

3. We are dependent on this customer. 1 2
3 4 5

4. We do not have a good substitute for this customer.
1 2 3 4 5

• **Does your company have the following feelings about this customer?**

1. We know that this supplier is sincere with us. 1
2 3 4 5

2. This supplier is genuinely concerned with our business success.
1 2 3 4 5

3. We believe in the information that this vendor provides us.
1 2 3 4 5

4. We trust this supplier. 1 2 3
4 5

• **Has your firm ever taken the following actions?**

1. Have taken measure to lower consumption of water, electricity, gas and petrol during the production or disposal processes.
1 2 3 4 5

2. Have recycled, reused and remanufactured materials or parts.
1 2 3 4 5

3. Have used cleaner/renewable technology to make savings in the usage of energy, water and waste.
1 2 3 4 5

4. Have redesigned production and operational processes to improve environmental efficiency.
1 2 3 4 5

5. Have done redesigning and improving products or services

1 2 3 4 5

to meet new environmental criteria.

6. Have done redesigning and improving products or services to meet environmental

1 2 3 4 5

standards on directives from the environmental authorities.
